

Online Shopping Application

An example of incremental development

An example of the **Incremental Software Development Model** could be a project where a team is developing an online shopping application. The development is done in small, manageable sections (increments), with each increment adding a specific set of features to the application.

Example: Online Shopping Application

Increment 1: Basic Framework

- **Features:**
 - User registration and login functionality.
 - Basic home page layout with product categories.
- **Goal:** Get the basic structure of the application up and running.

Increment 2: Product Catalog

- **Features:**
 - Adding products to the catalog.
 - Displaying products with descriptions, prices, and images.
- **Goal:** Expand the application to allow users to view products.

Increment 3: Shopping Cart and Checkout

- **Features:**
 - Adding items to a shopping cart.
 - Simple checkout process (add address, payment method).
- **Goal:** Allow users to purchase products.

Increment 4: Order History and User Profile

- **Features:**
 - Order history for users to view past orders.
 - Edit user profile functionality.
- **Goal:** Enhance the user experience and provide a complete shopping cycle.

Increment 5: Payment Integration

- **Features:**
 - Integrating with a payment gateway (e.g., PayPal, Stripe).
 - Securing payment transactions.
- **Goal:** Allow secure payments for users.

Key Characteristics of Incremental Development:

- **Phased delivery:** Each increment adds functionality, and the system is delivered step-by-step.
- **Feedback-driven:** At the end of each increment, feedback is gathered from stakeholders, and improvements are made in the next increment.
- **Flexibility:** Allows adjustments based on feedback, and new features can be added easily in future increments.
